This is a large size semi-cascade Bonsai Pemphis Acidula. I am showing the problem part on its cascading branch. I showed it to other bonsai masters before and they said that it is a worthless bonsai because it has a goiter. They have inspected it carefully and concluded that the goiter can not be removed because the life line passes through there. The large bump destroys the gradual taper of the trunk. Notice the lines where I will cut it. a good branch will be sacrificed in the process.

Now the problem part has been removed but the taper is not yet good. I have to transfer this pemphis acidula from my farm to my office for real serious work.
